MARRA, R.C., TREMARIN, P.I., ALGARTE, V.M., LUDWIG, T.V. **Epiphytic diatoms (Diatomeae) from Piraquara II urban reservoir, Paraná state.** *Biota Neotropica*. 16(4): e20160200. <http://dx.doi.org/10.1590/1676-0611-BN-2016-0200>

Abstract: We conducted a taxonomical study of epiphytic diatoms on the macrophytes *Polygonum hydropiperoides*, *Ludwigia peruviana* and *Alternanthera philoxeroides* collected in the mesotrophic reservoir Piraquara II flooded in 2009, located in the state of Paraná. A total of 135 infrageneric taxa were identified, among them five at generic level and other five are first records to the state. We provided illustration, valve metrics, meristics limits and taxonomic reference for each taxon. Also, life forms and species frequency are given. The most frequent diatoms totaled 15.3% of total identified taxa and sporadic species represented 54.7%. *Achnantheidium minutissimum* (Kützinger) Czarnecki and *Brachysira neoexilis* Lange-Bertalot occurred in more than 90% of analyzed samples. Among the very frequent diatoms we found other species included in *Achnantheidium*, *Fragilaria* and *Eunotia*. The solitary *Discostella stelligera* (Cleve & Grunow) Houk & Klee and the short chain *Aulacoseira tenella* (Nygaard) Simonsen are free living species that entangle among diatoms from the biofilm.

Keywords: Bacillariophyta, freshwater, macrophytes, mesotrophic, periphyton, taxonomy.

Diatomáceas epifíticas (Diatomeae) no reservatório urbano Piraquara II, estado do Paraná

Resumo: Realizamos um estudo taxonômico das diatomáceas epifíticas nas macrófitas: *Polygonum hydropiperoides*, *Ludwigia peruviana* e *Alternanthera philoxeroides*, coletadas no reservatório Piraquara II, uma represa urbana mesotrófica inundada em 2009, localizado no estado do Paraná. Um total de 135 táxons infragênicos foi determinado, entre os quais cinco foram citações pioneiras para o Estado. Ilustrações, limites métricos, merísticos e referências taxonômicas para cada táxon foram providenciadas. Também, dados sobre formas de vida e frequência das espécies foram adicionados. As diatomáceas mais frequentes totalizaram 15,3% dos táxons determinados e as espécies esporádicas representaram 54%. *Achnantheidium minutissimum* (Kützinger) Czarnecki and *Brachysira neoexilis* Lange-Bertalot ocorreram em mais de 90% das amostras analisadas. Dentre as diatomáceas muito frequentes encontram-se outras espécies de *Achnantheidium*, *Fragilaria* e *Eunotia*. *Discostella stelligera* (Cleve & Grunow) Houk & Klee, uma diatomácea solitária, e *Aulacoseira tenella* (Nygaard) Simonsen, com cadeias curtas, são espécies livres que se emaranham entre as diatomáceas do biofilme.

Palavras-chave: Bacillariophyta, água doce, macrófitas, perifiton, taxonomia.

Introduction

Stems of emergent macrophytes are suitable colonizable surfaces to epiphyton communities and are particularly able to transfer a small amount of nutrients to their epiphytes (Cattaneo & Kalff, 1979). As periphytic diatoms are sensitive to eutrophication, it is important to record the species that occurred at present for comparison to the future assemblies, helping to understand the relationship between the species and the trophic level of aquatic system. Informations about biodiversity represent a useful tool for ecological and applied studies, but an accurate taxonomy is fundamental. Identification to species level is time consuming and sometimes difficult, but useful and necessary to future ecological studies (Kociolek 2005) in this urban reservoir.

Cetto et al. (2004), Silva et al. (2010), Bertolli et al. (2010) and Faria et al. (2010) provided recent diatom inventories from eutrophic and mesotrophic urban reservoirs: Iraí, Passaúna and Itaquí. Also,

Faria et al. (2013) selected tolerant diatom species from Itaquí reservoir. There are no related studies in the recently flooded Piraquara II urban reservoir. Bittencourt & Gobbi (2006) evaluated phosphorous total maximum daily load in the drainage area of Piraquara II reservoir before flooding. The study demonstrated the reservoir present high potential to eutrophication due to the intense agricultural use of soil and shallow water. The urban reservoirs have been suffering severe anthropogenic nutrients inputs and consequently eutrophication is accelerated (Calisto et al., 2014) and periphyton may respond by changes in abundance and taxonomic composition (Stoermer & Smol 2004).

We conducted a taxonomical study of epiphytic diatoms in Piraquara II reservoir. For each taxon, we provided illustration, valve metrics and meristics limits, occurrence, and literature to species taxonomic determination. The taxa first registered to state of Paraná were also described and commented.

Materials and Methods

Piraquara II reservoir (25°30' S and 49°00' W) is located in a preservation area and was built in 2008 by the dam of Piraquara river, inserted in the Iguaçu watershed, Paraná state, south Brazil (Figure 1). This shallow reservoir with 75 days of water retention time is used for public supply (depth 3.7 m, area 5.64 km², drainage area 58 km²), and is mesotrophic most part of the year (Table 1, SANEPAR, 2013, unpublished data) with Trophic State Index (TSI) around 54 from 55 TSI (SANEPAR, 2010-2014, unpublished data). The main economic activities in the vicinity are the livestock and corn culture (Bittencourt & Gobbi 2006).

Epiphytic diatoms were sampled in June and November 2013 from stems of the emergent macrophytes *Polygonum hydropiperoides* Michaux (Polygonaceae), *Ludwigia peruviana* (L.) H. Hara (Onagraceae) and the amphibious *Alternanthera philoxeroides* (Mart.) Griseb. (Amaranthaceae). The macrophytes were collected according to the local availability in six sampling sites (1-6) along the reservoir (Table 2, Figure 1), three stems (a,b,c) from each core were collected. Diatoms were scrapped off the

substrates surfaces with an aluminium spatule, and the samples were cleaned with KMnO₄ and HCl (Simonsen 1974 modified by Moreira-Filho & Valente-Moreira 1981). Light microscopy-slides were mounted with Naphrax® and analyzed under Olympus BX40 microscope. Illustrations were captured by DP71 digital equipment. Cleaned samples were prepared and analysed at JEOL JSM 6360LV scanning electron microscope (Eletronic Microscopy Center - Federal University of Paraná). Valve terminology followed Barber & Haworth (1981) and Round et al. (1990). Frequencies of occurrence were established based on Mateucci & Colma (1982): species as high frequent ($F \geq 70\%$), frequent ($40\% \leq F < 70\%$), low frequent ($10\% \leq F < 40\%$) and sporadic ($F < 10\%$).

The examined slides and samples were housed at the herbarium of the Universidade Federal do Paraná (UPCB) (Table 2). First recorded taxa to the state of Paraná and those identified to the generic level were described and commented. Diatoms were identified to the lowest taxonomical level according to current taxonomic literature. The references used to identify each taxon even as metrics and meristics limits are listed on Table 3.

Results and Discussion

A total of 135 infrageneric diatoms taxa were identified (Table 3, Figures 2-222), representing eighteen families (Round et al. 1990, Kulikovskiy et al., 2014). The species richness from Piraquara II reservoir was higher than the diatom floras found in the nearby urban reservoirs Irai (96 taxa), Passaúna (106 taxa) and Itaquí (124 taxa) (Silva et al. 2010, Bertolli et al. 2010, Faria 2010). In June, (127 taxa) it was found higher richness than in November (66 taxa).

The diatoms occurring highly frequent were (10 taxa): *Achnanthisdium caledonicum* (Lange-Bertalot) Lange-Bertalot, *Achnanthisdium macrocephalum*

(Hustedt) Round & Bukhtiyarova, *Achnanthisdium minutissimum* (Kützing) Czarnecki, *Aulacoseira tenella* (Nygaard) Simonsen, *Brackysira neoexilis* Lange-Bertalot, *Discostella stelligera* (Cleve & Grunow) Houk & Klee, *Eunotia pseudosudetica* Metzeltin, Lange-Bertalot & García-Rodríguez, *Eunotia intermedia* (Krasske) Nörpel-Schempp & Lange-Bertalot, *Fragilaria recapitulata* Lange-Bertalot & Metzeltin and *Fragilaria parva* (Grunow) Tuji & Williams. Diatoms registered as frequent were (11 taxa): *Achnanthisdium catenatum* (Bily & Marvan) Lange-Bertalot, *Achnanthisdium eutrophilum* (Lange-Bertalot) Lange-Bertalot, *Aulacoseira ambigua* (Grunow) Simonsen f. *ambigua*, *Aulacoseira granulata* (Ehrenberg) Simonsen var. *granulata*, *Eunotia bilunaris* (Ehrenberg) Mills, *Encyonema neograticum* Krammer,

Diatoms from Piraquara II reservoir. 202. *Nitzschia vermicularis*. 203. *N. clausii*. 204. *Surirella angusta*. 205. *S. tenuissima*. 206. *Stenopterobia curvula*. 207. *S. delicatissima*. 208. *Surirella lineares* var. *helvetica*. 209. *Surirella* sp. 210. *Rophalodia gibberula*. 211. *Surirella splendida*. 212. *S. biseriata* var. *constricta*. Scales: 10 μm.

Figures 213-216. Diatoms from Piraquara II reservoir (SEM). 213. Internal view of *Gomphonema naviculoides*, scale: 5 μm . 214. Internal view of *G. graciloides*, scale: 5 μm . 215. Headpole of *G. graciloides* in internal view, scale: 1 μm . 216. Median region of *G. graciloides* showing the proximal raphe ends and the stigma opening in internal view, scale: 2 μm .

Fragilaria tenera (W. Smith) Lange-Bertalot, *Fragilaria microvaucheriae* Wetzel & Ector, *Gomphonema graciloides* Hustedt, *Gomphonema lagenula* Kützing and *Nitzschia palea* (Kützing) W. Smith. Altogether the more frequent diatoms totaled 15.3% of 135 taxa identified and 54.7% were sporadic in the reservoir.

Achnanthidium minutissimum and *Brachysira neoexilis* were the most frequent taxa present in 90% of the samples. Among the very frequent diatoms we found other species included in *Achnanthidium*, *Fragilaria* and *Eunotia*. The solitary *Discotella stelligera* and the short chain *Aulacoseira tenella* are free living species that entangled among diatoms from the biofilm.

Description and comments of specimens not identified and first registered to the state of Paraná are bellow.

Aulacoseiraceae

Aulacoseira sp.

Figs 5, 7

Frustules solitary or in short chains. Valves circular, shallow ringlike; inconspicuous striae, areolae and spines.

Aulacoseira sp. resembles *A. simoniae* Tremarin, Torgan & Ludwig and *A. tenella*, differing by the conspicuous ornamentation of the latter species (Tremarin et al. 2014). Specimens were rare in samples, making detailed analysis impracticable.

Eunotiaceae

Eunotia cf. *formicina* Lange-Bertalot in Lange-Bertalot et al., Diatoms of Europe 6: 105; pl. 222, figs 1-7, pl. 223, 2011.

Fig. 53

Valves with dorsal margin convex, ventral margin concave, ends rounded, not detached from the valve, striae parallel to radiate near the apices.

Eunotia formicina was recently proposed (Lange-Bertalot et al. 2011) to nominate morphotypes of *E. formica* Ehrenberg distinguished by rounded ends, narrower valve (6-8 μm) and denser areolae (25-28 in 10 μm) in the striae (8-12 in 10 μm). *Eunotia formica* shows cuneate poles, wider valves (7-14 μm) and less denser striae (6-12 in 10 μm). Central delicate gibbosity at ventral margin of *E. formicina* was not observed in our specimens and the striae are originally less dense.

Gomphonemataceae

Gomphonema guaraniarum Metzeltin & Lange-Bertalot in Lange-Bertalot, Iconogr. Diatomol. 18: 147, pl. 212, figs 9-14, 2007.

Figs 84-87

Valves rhombic-lanceolate, slightly heteropolar, ends acute, raphe-sternum linear and straight, central area unilaterally expanded with a stigma at the opposite side, striae distinctly punctuate, parallel to radiate toward the ends.

Gomphonema sp.

Figs 118-119

Valves narrowly lanceolate, heteropolar, ends acute, raphe-sternum linear and straight, central area with a stigma at the end of a stria, striae radiate, areolae inconspicuous.

Gomphonema sp. is similar to *G. geisslerae* Reichardt & Lange-Bertalot in outline (length 18-27.5 μm , width 2.6-3.8 μm), but is wider (Reichardt 1997).

Figures 217-222. Diatoms from Piraquara II reservoir (SEM). 217. External view of *Sellaphora sassiana* showing the striation pattern, proximal and distal raphe ends, scale: 5 μm . 218. *Sellaphora sardinensis* in external view showing the shape of areolae, proximal and distal raphe ends, scale: 1 μm . 219. Raphe valve of *Achnanthidium macrocephalum* in external view, scale: 1 μm . 220-221. *Fragilaria pectinalis* in external view, scales: 5 μm . 222. Detail of apical pore field of *Fragilaria pectinalis*, scale: 1 μm .

Achnanthidiaceae

Achnanthidium macrocephalum (Hustedt) Round & Bukhtiyarova, Diatom Res. 11: 349, 1996.

Figs. 114-115, 219

Valves lanceolate, ends capitate, sternum narrow and linear, central area round, slightly expanded, raphe straight, striae inconspicuous.

The measurements of analysed specimens agree with the limits given by Krammer & Lange-Bertalot (1991b) of species *Achnanthes minutissima* var. *macrocephala* Hustedt (length 6-14 μm , width 2.5-3 μm).

Achnanthidium reimeri (Camburn) Ponader & Potapova present similar outline, but the valve is wider (9.4-13.5 μm long, 2.9-3.2 μm wide) and the apices are more rounded. Also, *A. latecephalum* Kobayasi has similar outline, but the capitate ends and parallel striae distinguish the species from *A. macrocephalum* (Ponader & Potapova 2007).

Amphipleuraceae

Frustulia quadrisinuata Lange-Bertalot in Lange-Bertalot & Metzeltin, Iconogr. Diatomol. 2: 59-60, pl. 38, figs 10-12, pl. 119, figs 1-1, 1996.

Fig. 157

Valves lanceolate with margins slightly triundulate, ends rostrate, raphe-sternum narrow and linear, with longitudinal costa constricted at the central area, raphe straight, striae inconspicuous.

Sellaphoraceae

Sellaphora sardiniensis Lange-Bertalot, Cavacini, Tagliaventi & Alfinito in Lange-Bertalot, Iconogr. Diatomol. 12: 122; pl. 19, fig. 1-9, pl. 20, fig. 1-5, 2003.

Figs. 149-150, 218

Valves elliptic, ends subcapitate, raphe-sternum narrow and linear, central area elliptic, limited by irregular shortening striae, raphe straight, striae radiate.

Sellaphora sardiniensis resembles *S. subpupula* Levkov & Nakov, but the latter taxon have central area laterally expanded and denser striae (27-30 in 10 µm) (Lange-Bertalot et al. 2003; Levkov et al. 2007).

Sellaphora sp.

Fig. 148

Valves linear-lanceolate, ends subcapitate, raphe-sternum narrow and linear, elliptic central area limited by irregular shortening striae; raphe straight with proximal ends curved to the same side, striae radiate.

Sellaphora sp. is similar to *S. rhombicarea* Metzeltin, Lange-Bertalot & García-Rodríguez in outline, but differs in the dimensions (length 24-50 µm, width 9.5-11 µm, 17-19 striae in 10 µm) (Metzeltin et al. 2005). *Sellaphora laevis* (Kützinger) Mann is larger and striae less dense (length 6-9.3 µm and 15-19 striae in 10 µm) (Zimmerman et al. 2010).

Surirellaceae

Surirella sp.

Fig. 209

Valves isopolar, linear to lanceolate, slightly constricted in the middle, ends cuneate-rounded. Aliform channels parallel, straight to slightly radiated near the ends, striae inconspicuous.

Acknowledgments

The authors thank CAPES (Coordenação de Aperfeiçoamento de Pessoal de Nível Superior) for the Masters and pos doctoral scholarships granted to RC Marra and PI Tremarin, respectively; to CNPq (Conselho Nacional de Desenvolvimento Científico e Tecnológico) for the research productivity scholarship awarded to TAV Ludwig. Also, we thank Dr. Maurício Bergamini Scheer for the help with fieldwork and SANEPAR (Companhia de Saneamento do Paraná) for field logistic assistance. Financial support was provided from the Araucária Foundation (5929/2011).
