Recently during a trip to the Puketi forest by the Natural History Club, Mr. Warren tells me of two interesting finds. First, Bulbophyllum tuberculatum Col., a little orchid we discussed in the last number of the News Letter and secondly Macroglena strictum (Menzies) Copeland. This and Selenodesmium elongatum (A. Cunn.) Copeland, are the two of our Bristle Ferns having tufted rhizomes. S. elongatum is common on the Waitakeres but I have not so far encountered the Erect Bristle Fern. It is to be looked for there at high altitudes, probably at the head of a creek in a damp shady place. I see no reason why members should not come across it in suitable localities.

Reminder to Members

Our very alert Treasurer has sent in the following note:

Subscriptions for the year 1962 are now due. The Treasurer would be pleased to receive payment from members without the necessity for sending out notices as this will help to keep down the stationery costs.

Our deep sympathy to Miss Margaret Segar in her recent accident and best wishes for her recovery.
