

Introduction	1
1. Synthetic biology overview	2
a) Standard components (Standardization)	5
b) Hierarchy of abstraction	7
c) Ability to compose	7
2. Plant Synthetic Biology	9
a) From Mendelian Genetics to Recombinant DNA: A short historical perspective in plants	9
b) Enhancing Global Food Security Through Genetic Engineering	10
c) Plants as Bioreactors: The Frontier of Sustainable Bioproduction	11
d) Beyond Single Genes to Integrated Networks: The particularities of Plant Synthetic Biology	13
e) Multi-gene engineering (MGE): from single loci to systems rewiring	13
f) Programming Plants: Synthetic Transcriptional Genetic Circuits	16
3. New tools for creating improved Synbio plant circuits	21
a) Circuit Design and Computed Aided Design Softwares	22
b) Biosensors	23
c) Recombinases and memory systems	24
d) Genome Editing Tools	24
e) Reporters for DBTL Cycles	27
Objectives	33
Chapter 1: STRONG AND TUNABLE ANTI-CRISPR/Cas ACTIVITIES IN PLANTS	35
SUMMARY	37
INTRODUCTION	38
RESULTS	39
AcrIIA4 and AcrVA1 prevent editing and CRISPRa in <i>N. benthamiana</i>	39
AcrIIA4 prevents CRISPRa in <i>N. benthamiana</i> in a regulable fashion	41
AcrIIA4 prevents CRISPRa of endogenous genes in <i>N. benthamiana</i>	46
DISCUSSION	47
EXPERIMENTAL PROCEDURES	49
SUPPORTING INFORMATION	52

Chapter 2: A QUANTITATIVE AUTONOMOUS BIOLUMINESCENCE REPORTER SYSTEM WITH A WIDE DYNAMIC RANGE FOR PLANT SYNTHETIC BIOLOGY 60

SUMMARY 62

INTRODUCTION 63

RESULTS 64

Setting up an easy-to-use quantitative bioluminescence reporter system 64

Phytohormone sensors with the FBP[HisP]/eGFP reporter 68

Diversifying copper switches in plants using the FBP/eGFP reporter system 70

Dual chemical-optogenetic control of the FBP 72

Generation of stable reporter plant lines for FBP[HisP]/eGFP 74

DISCUSSION 75

EXPERIMENTAL PROCEDURES 77

SUPPORTING INFORMATION 80

Chapter 3: A NOVEL FUNGAL BIOLUMINESCENCE PATHWAY-BASED BRET SYSTEM FOR PLANT BIOTECHNOLOGY 90

SUMMARY 92

INTRODUCTION 93

RESULTS 94

Selection and orientation dependence of an adequate donor-acceptor pair for the FBP in plant cells 94

F-BRET allows rapid diagnosis of potyviral infection in plants 97

DISCUSSION 99

EXPERIMENTAL PROCEDURES 101

SUPPORTING INFORMATION 104

General Discussion and Future Perspectives 109

A New Layer of Control: Post-translational Switches Based on Anti-CRISPRs 110

Accelerating the Testing Cycle: An Autonomous and Quantitative Reporter 111

Closing the Loop: A Biosensor Application for Pathogen Diagnostics 112

Final Remarks 113

Conclusions 115
